

TUTORIAL 14: RECAP ON VALIDATION

Creating Business Value with Generative AI
Fall 2025

DEPARTMENT OF MANAGEMENT
AARHUS UNIVERSITY

5. December 2025

Magnus Bender
Assistant Professor

AGENDA FOR TODAY

AGENDA FOR TODAY

A. Validation in general

AGENDA FOR TODAY

- A. Validation in general
- B. An exemplary mini project
 - a. Data generation
 - b. An app
 - c. Validation
 - d. Archive export for WISEflow

AGENDA FOR TODAY

- A. Validation in general
- B. An exemplary mini project
 - a. Data generation
 - b. An app
 - c. Validation
 - d. Archive export for WISEflow
- C. Teaching evaluation

VALIDATION IN GENERAL

- Overview
- Metrics

OVERVIEW

- A system (LLM, etc.) makes predictions based on inputs

OVERVIEW

- A system (LLM, etc.) makes predictions based on inputs
- For a validation we need data:

OVERVIEW

- A system (LLM, etc.) makes predictions based on inputs
- For a validation we need data:
 - Inputs to the system

OVERVIEW

- A system (LLM, etc.) makes predictions based on inputs
- For a validation we need data:
 - Inputs to the system
 - The desired outputs for the inputs

Data with labels
(real or synthetic)

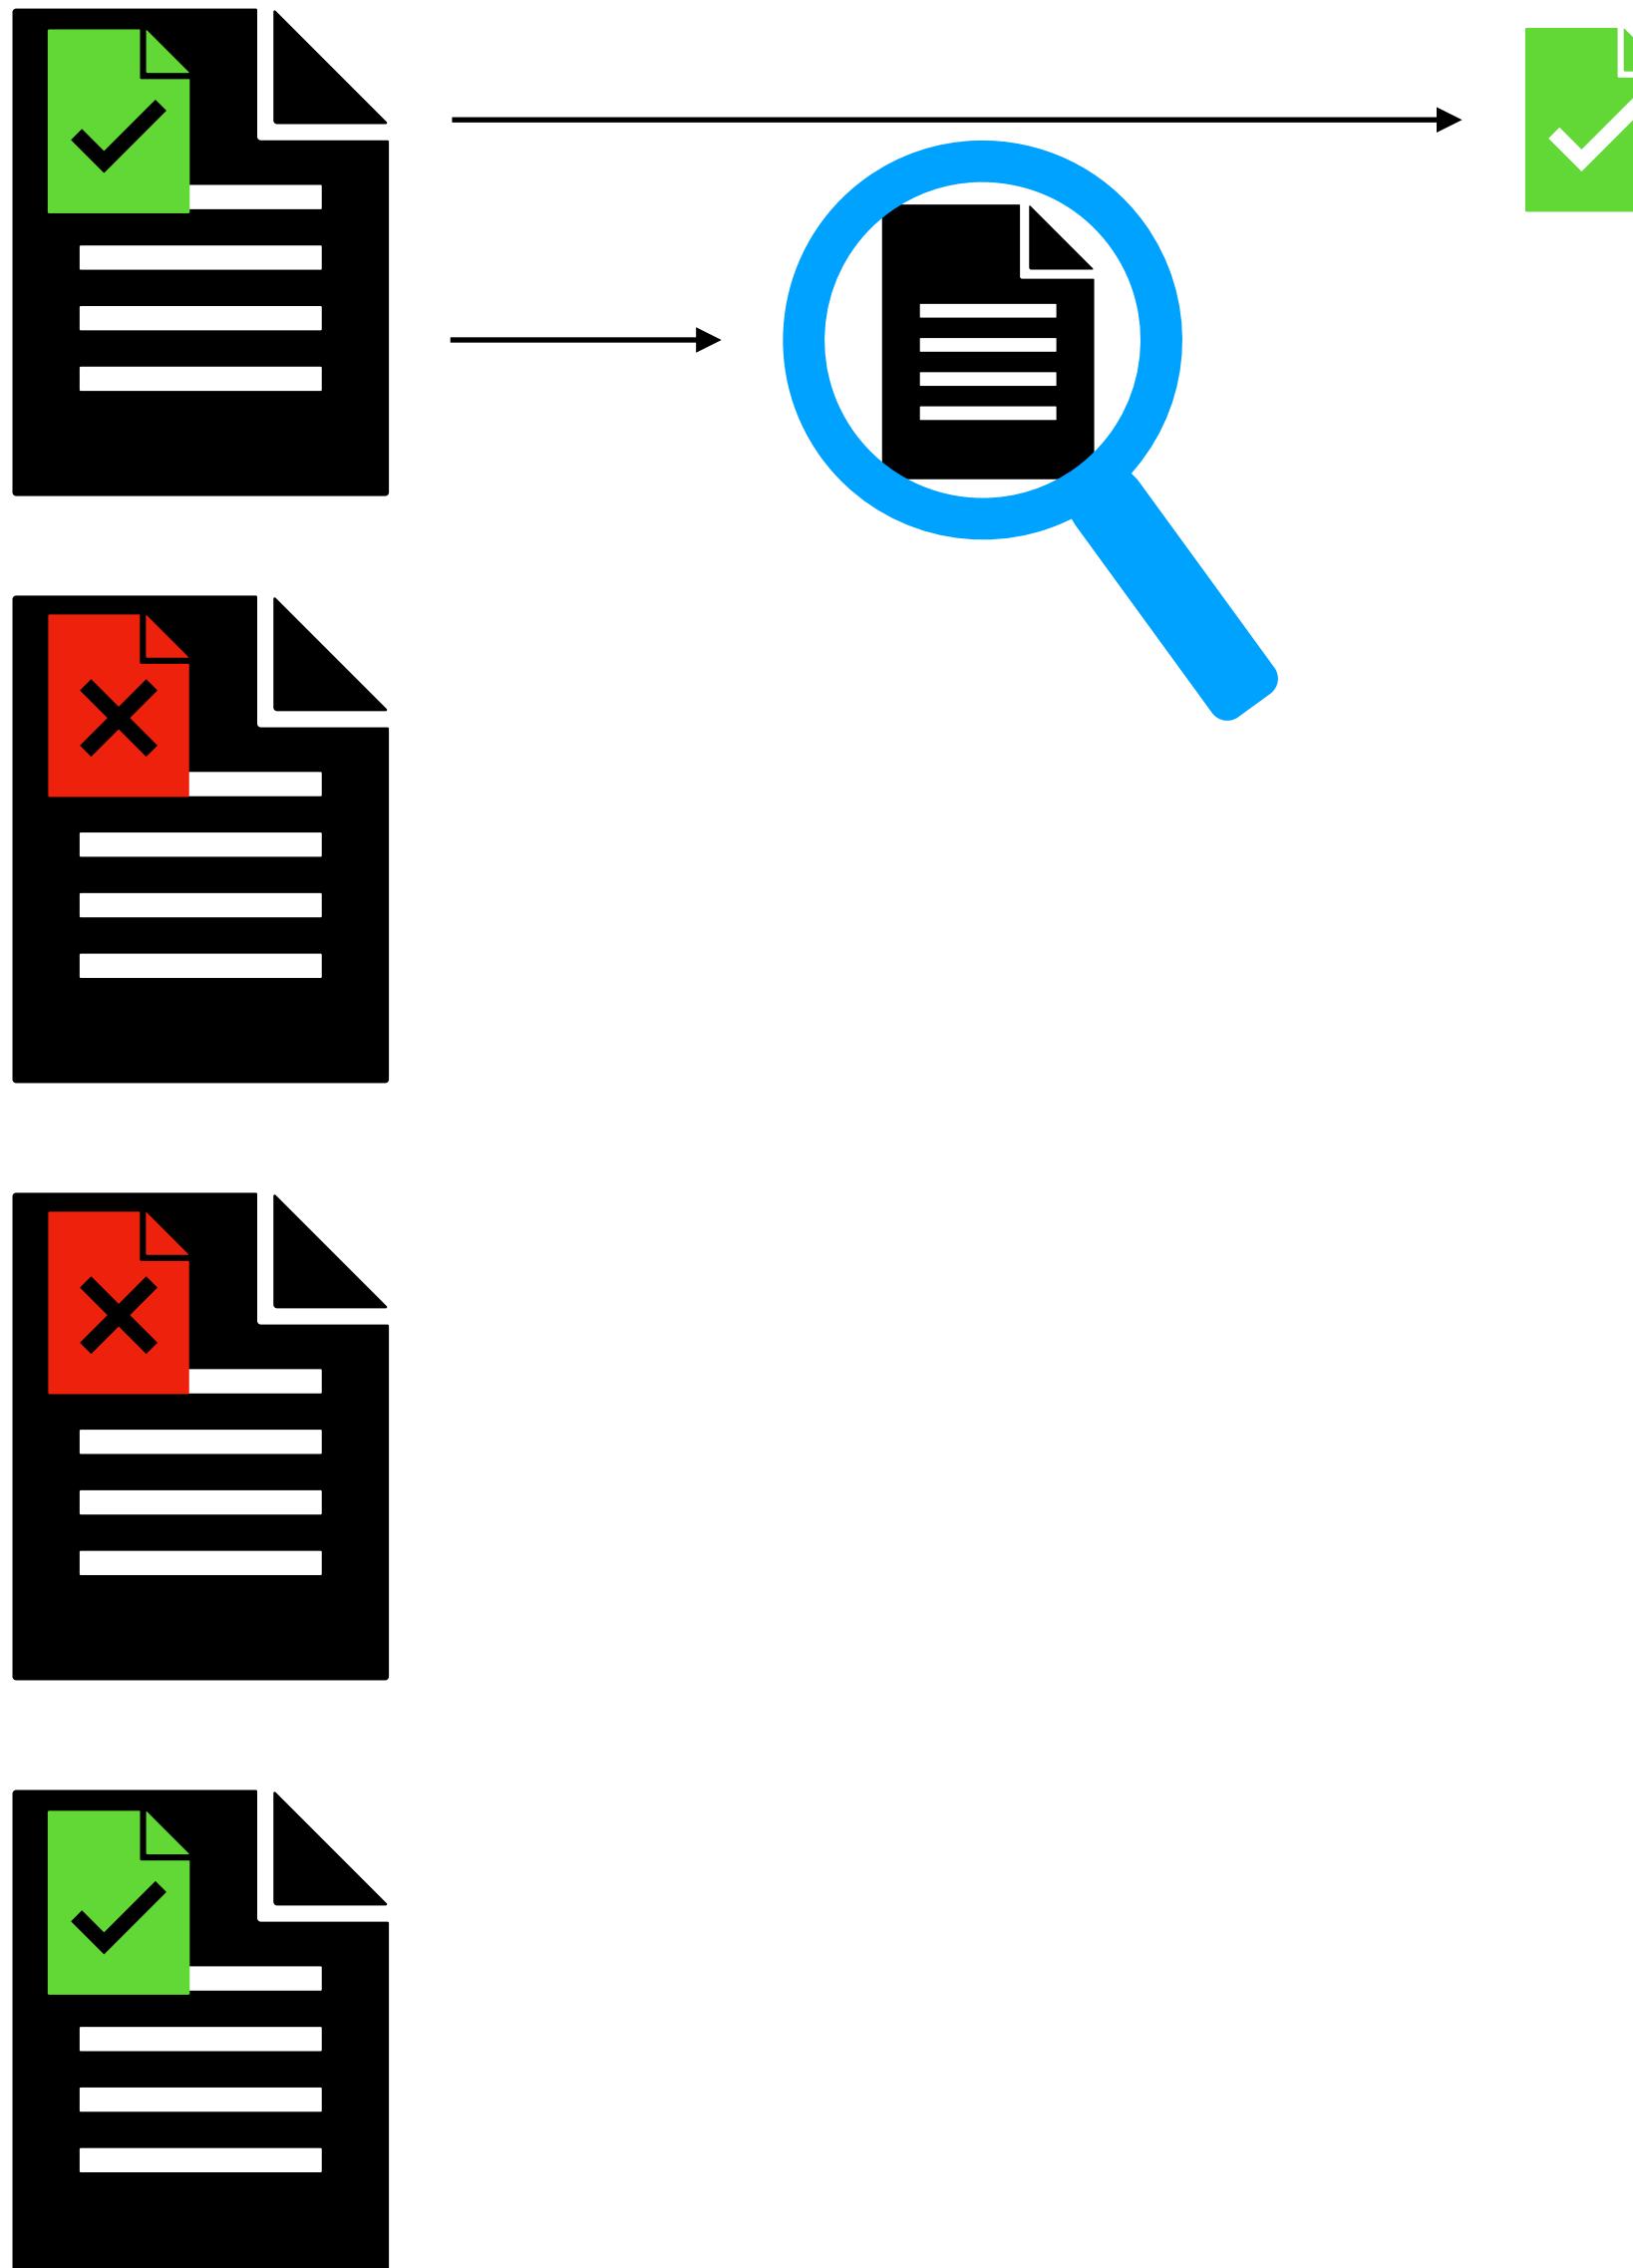

OVERVIEW

- A system (LLM, etc.) makes predictions based on inputs
- For a validation we need data:
 - Inputs to the system
 - The desired outputs for the inputs

OVERVIEW

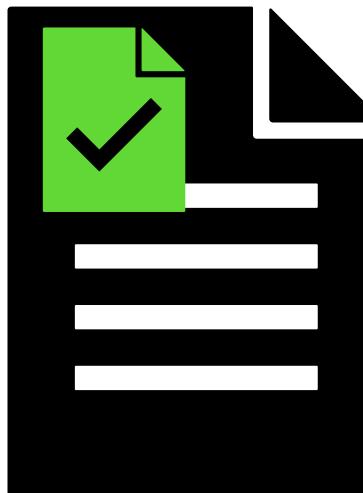

- A system (LLM, etc.) makes predictions based on inputs
- For a validation we need data:
 - Inputs to the system
 - The desired outputs for the inputs

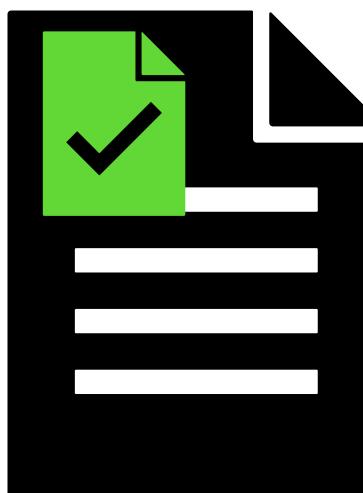

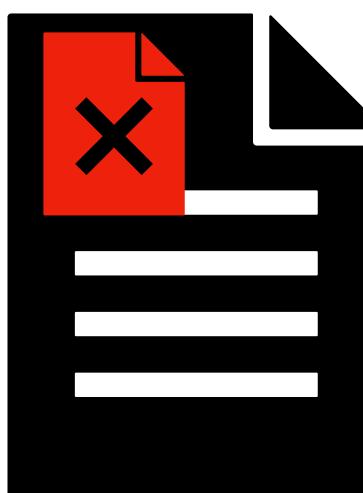

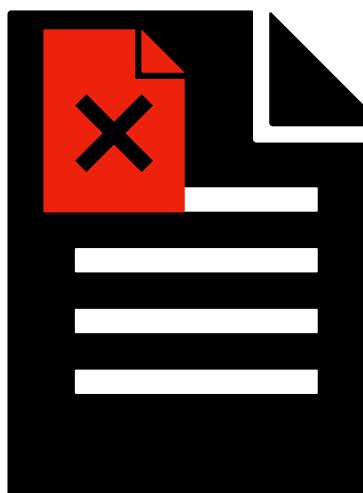

OVERVIEW

- A system (LLM, etc.) makes predictions based on inputs
- For a validation we need data:
 - Inputs to the system
 - The desired outputs for the inputs

Data with labels
(real or synthetic)

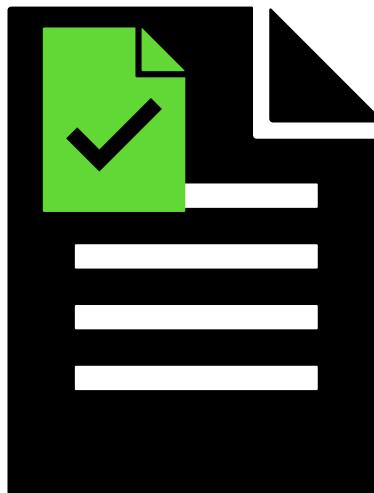

Use the system to
calculate predictions

OVERVIEW

- A system (LLM, etc.) makes predictions based on inputs
- For a validation we need data:
 - Inputs to the system
 - The desired outputs for the inputs
 - A way to compare of prediction matches desired output

Data with labels
(real or synthetic)

Use the system to calculate predictions

Predictions and labels

Match between prediction and ground truth

OVERVIEW

- A system (LLM, etc.) makes predictions based on inputs
- For a validation we need data:
 - Inputs to the system
 - The desired outputs for the inputs
 - A way to compare of prediction matches desired output
- Do all the predictions and count matches and missmatches

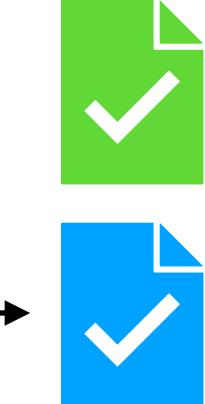

Data with labels
(real or synthetic)

Use the system to
calculate predictions

Predictions and
labels

Match between
prediction and
ground truth

OVERVIEW

- A system (LLM, etc.) makes predictions based on inputs
- For a validation we need data:
 - Inputs to the system
 - The desired outputs for the inputs
 - A way to compare of prediction matches desired output
- Do all the predictions and count matches and missmatches

Data with labels
(real or synthetic)

Use the system to calculate predictions

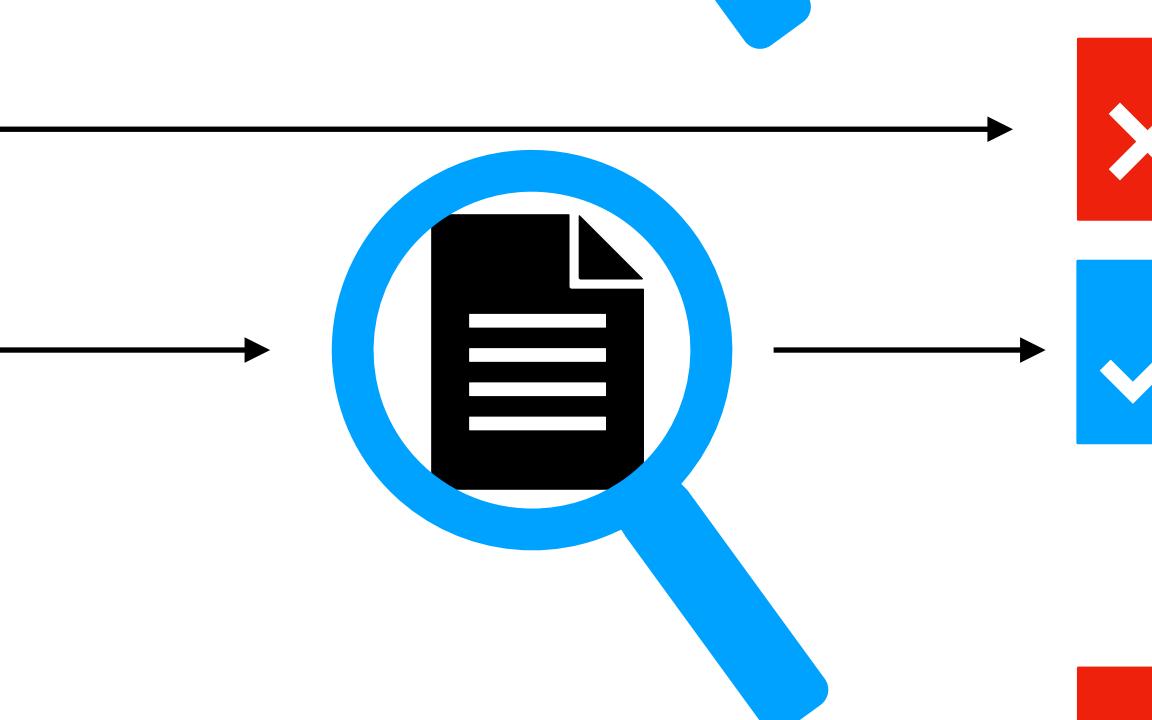

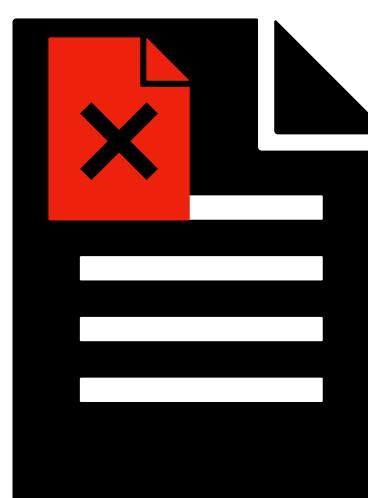

Predictions and labels

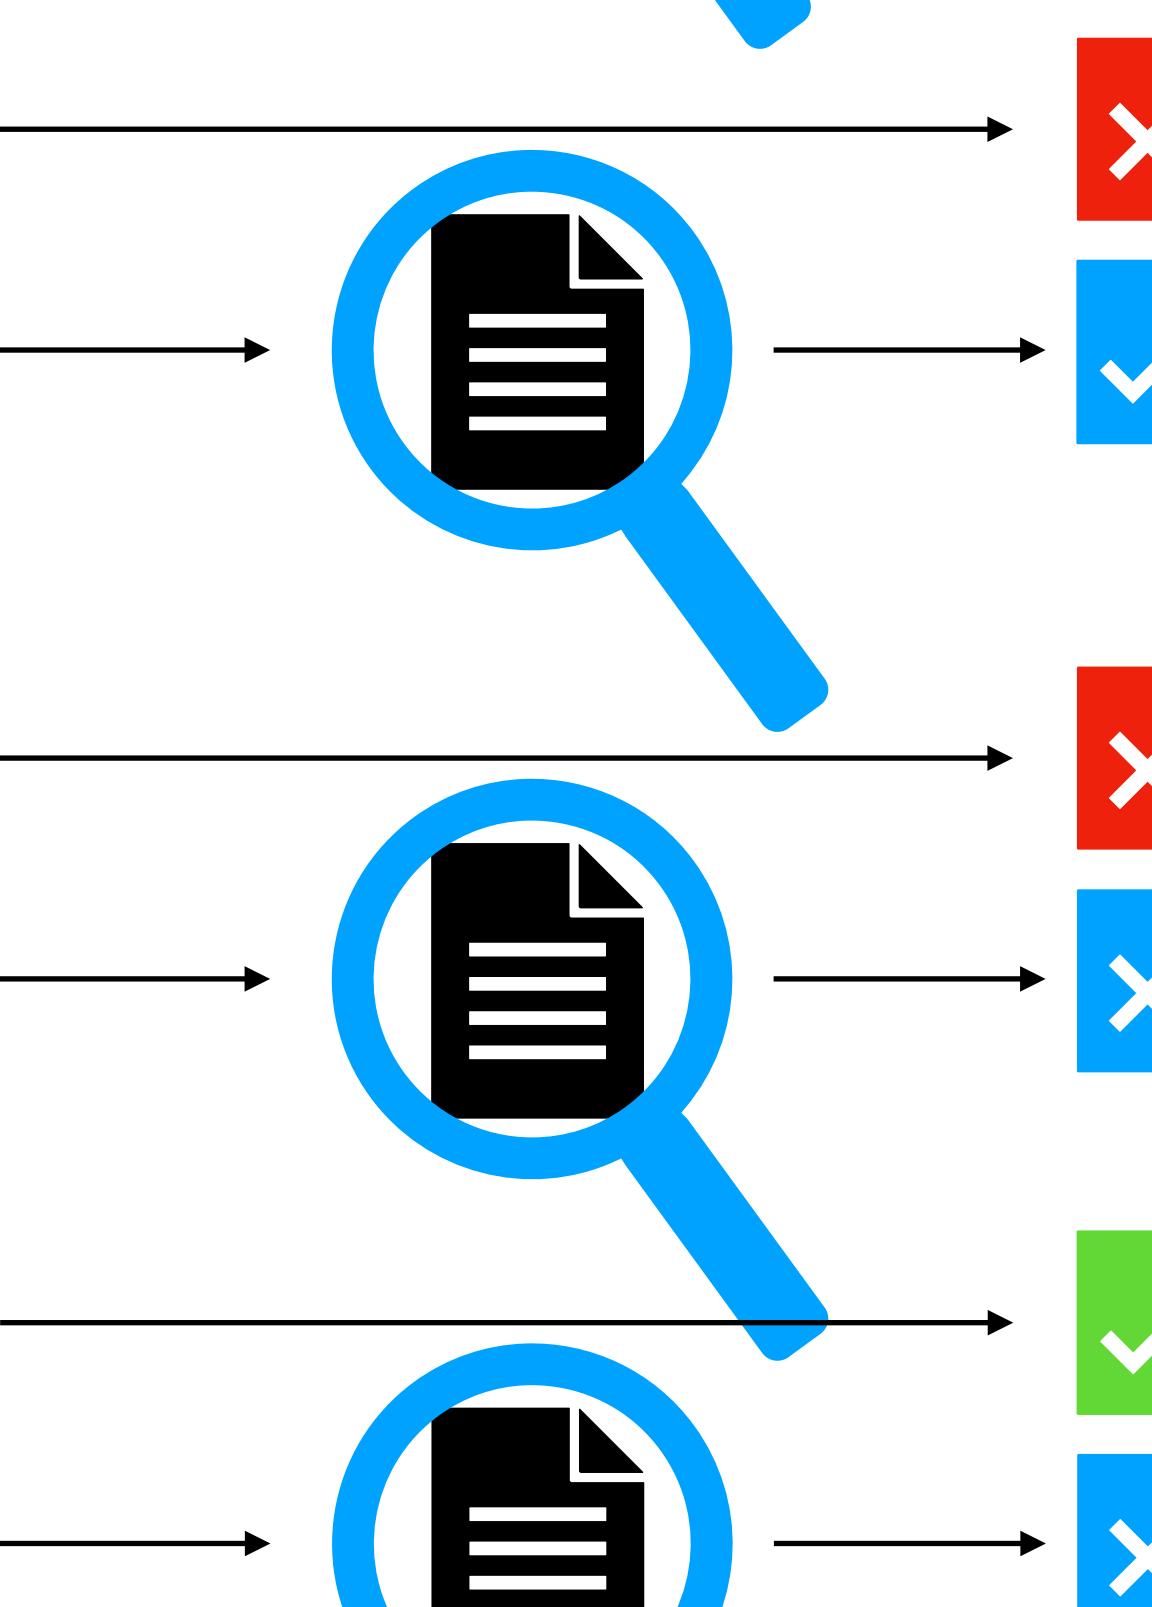

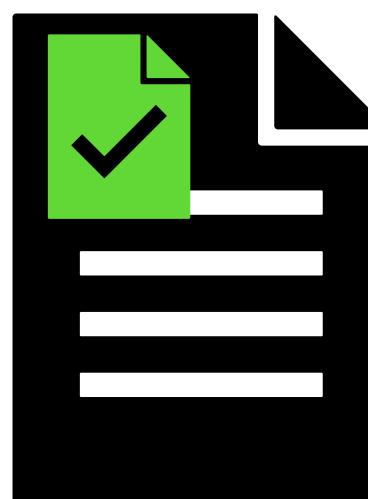

Match between prediction and ground truth

Mismatch between prediction and ground truth

Match between prediction and ground truth

Mismatch between prediction and ground truth

OVERVIEW

- A system (LLM, etc.) makes predictions based on inputs
- For a validation we need data:
 - Inputs to the system
 - The desired outputs for the inputs
 - A way to compare of prediction matches desired output
- Do all the predictions and count matches and missmatches

Data with labels
(real or synthetic)

Use the system to calculate predictions

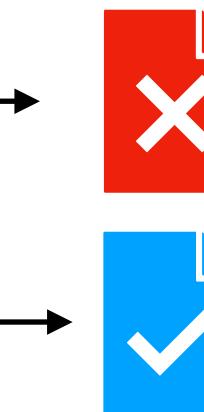

Predictions and labels

Match between prediction and ground truth

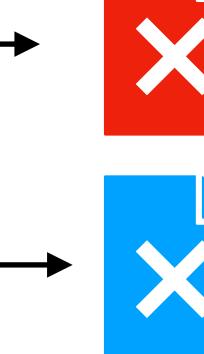

Mismatch between prediction and ground truth

Accuracy:
50%

Match between prediction and ground truth

Mismatch between prediction and ground truth

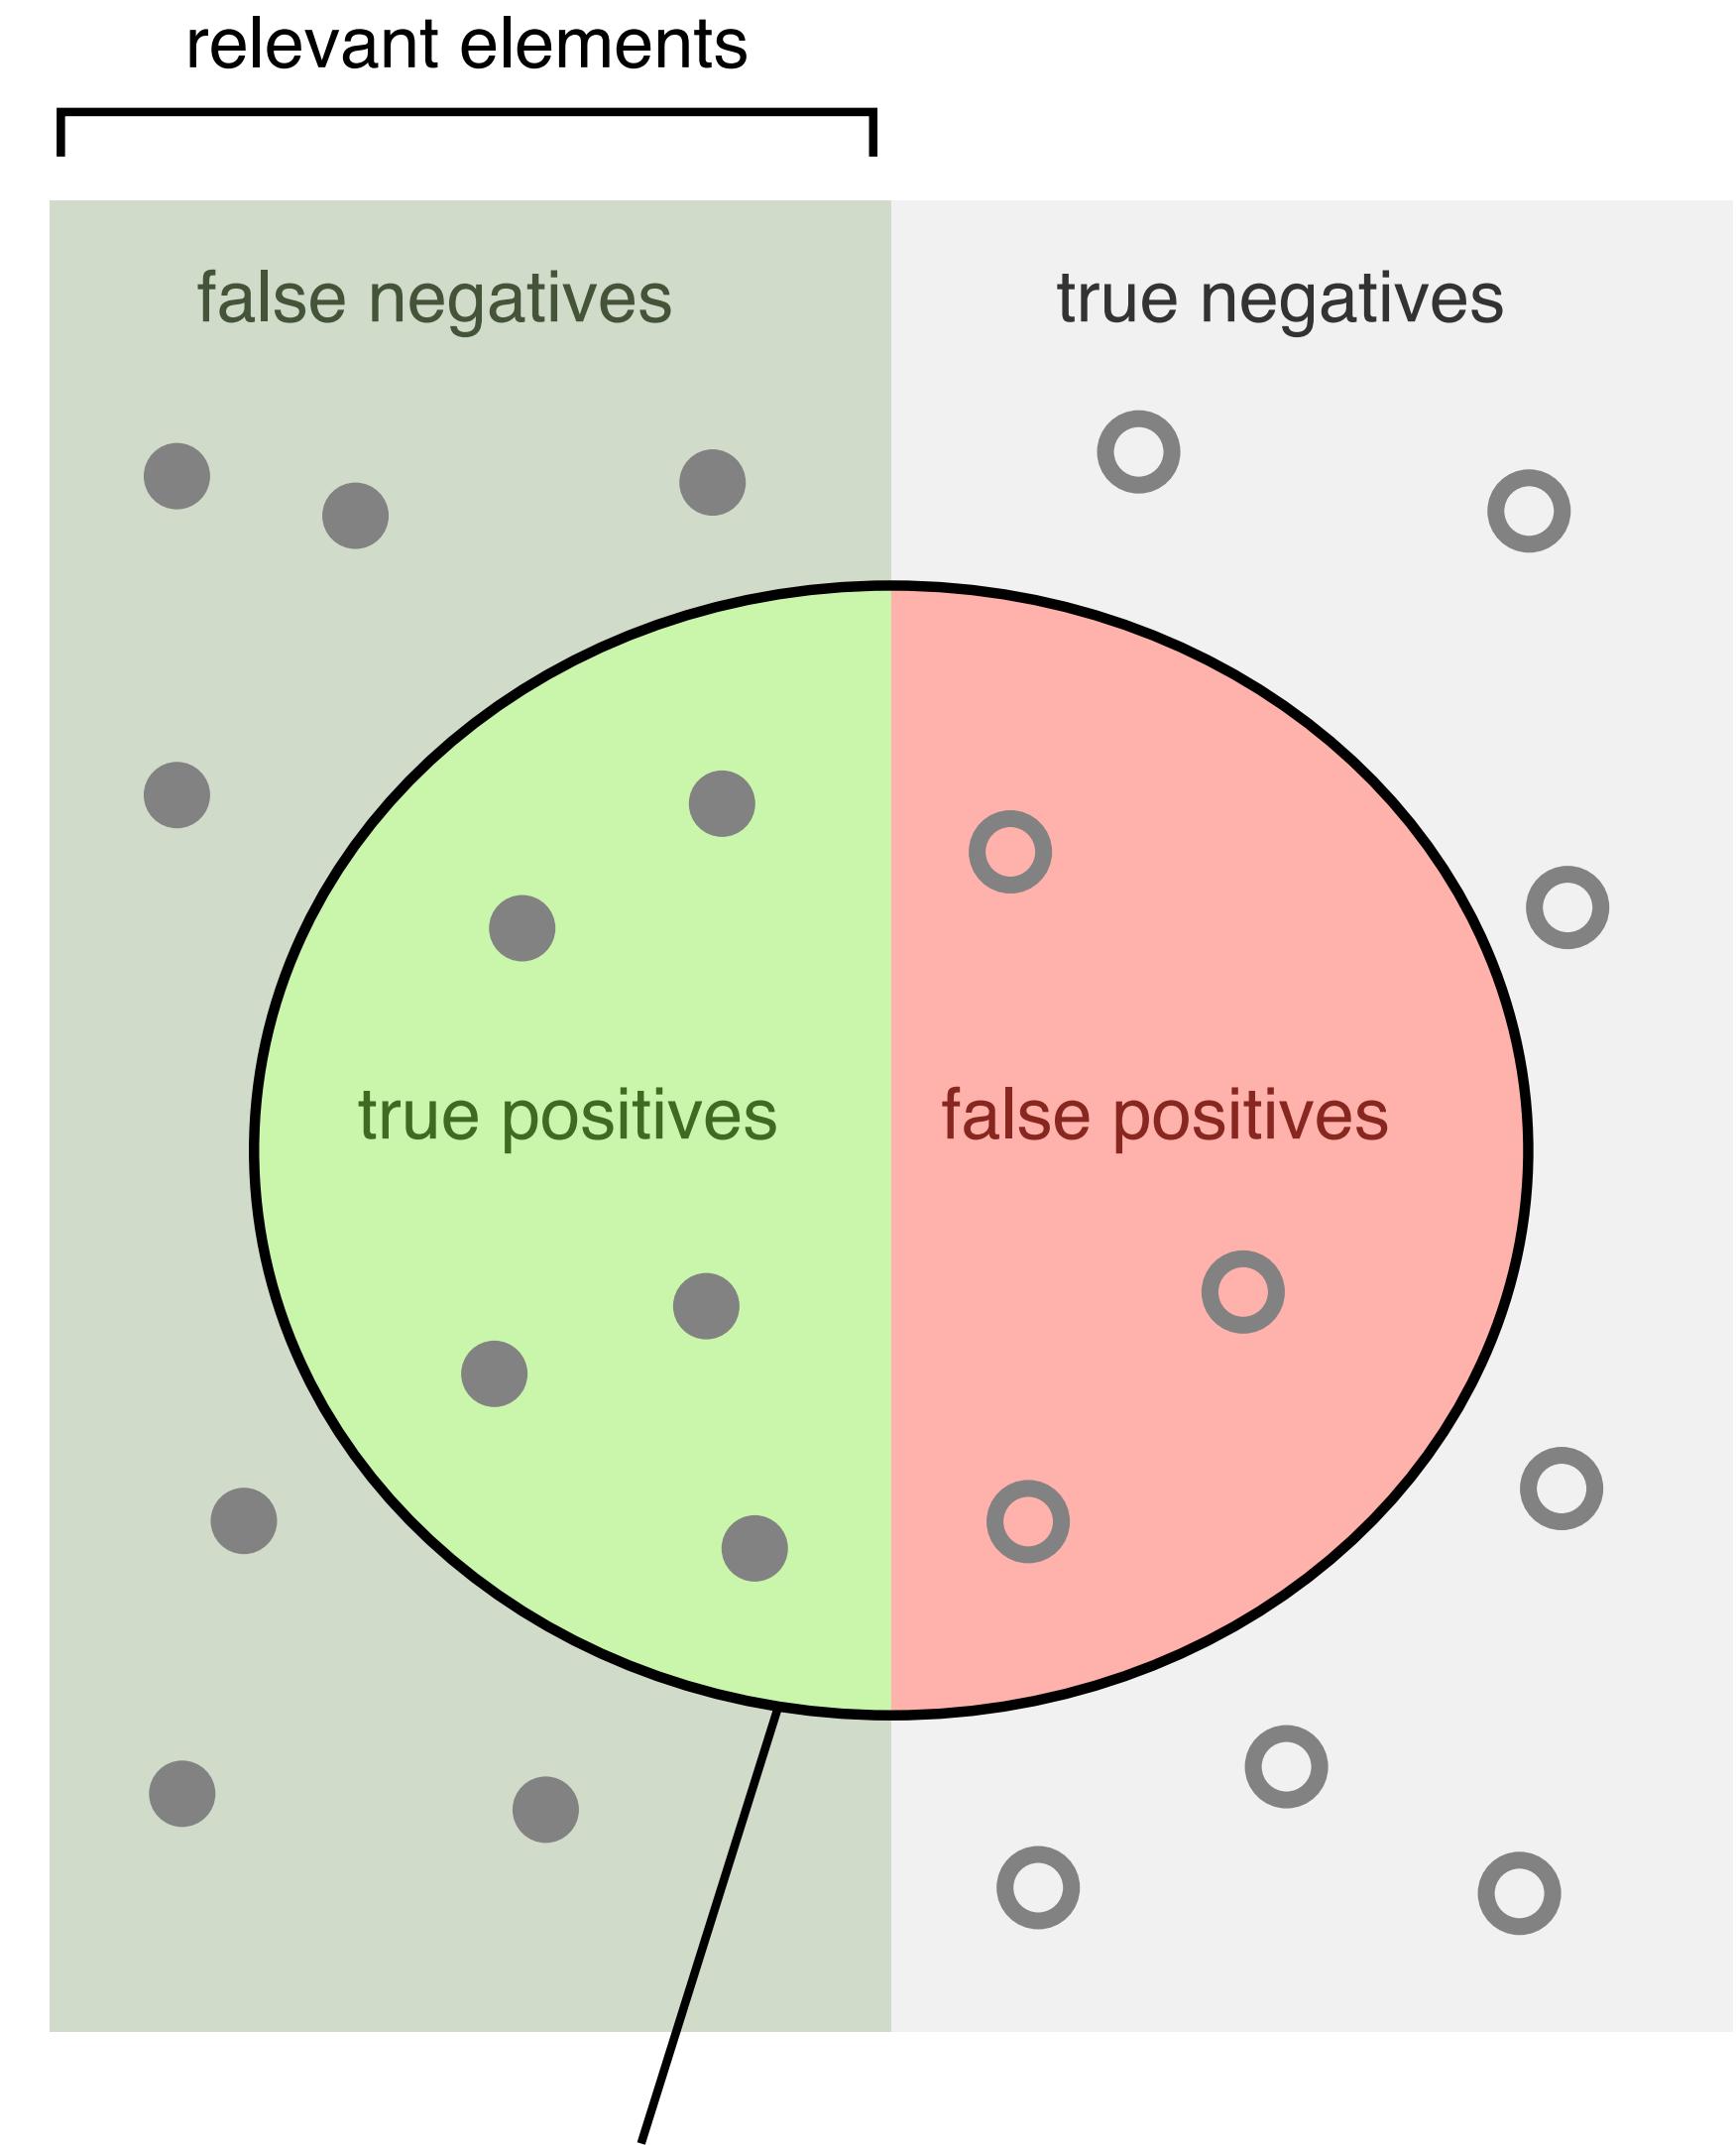

METRICS

		Prediction	
		Positive	Negative
Actual	Positive	True positive (tp)	False negative (fn)
	Negative	False positive (fp)	True negative (tn)

METRICS

AN EXEMPLARY MINI PROJECT

- Data generation, app, and validation
- Archive export for WISEflow

THE USE-CASE: SALUTATION ANALYSIS

THE USE-CASE: SALUTATION ANALYSIS

- Input is a salutation: „Hey“, „Hi“, „Hello“, „God dag!“, „Kære“, etc.

THE USE-CASE: SALUTATION ANALYSIS

- Input is a salutation: „Hey“, „Hi“, „Hello“, „God dag!“, „Kære“, etc.
- Output for each salutation:
 - Language (English, Danish, ...)
 - Level of formality (Formal, Informal, ...)
 - Time of day (Morning, Evening, ...)

THE USE-CASE: SALUTATION ANALYSIS

- Input is a salutation: „Hey“, „Hi“, „Hello“, „God dag!“, „Kære“, etc.
- Output for each salutation:
 - Language (English, Danish, ...)
 - Level of formality (Formal, Informal, ...)
 - Time of day (Morning, Evening, ...)
- Three steps
 1. Generate synthetic data using OpenAI API: [Magnus_Recap/data_generation/generate.ipynb](#)

THE USE-CASE: SALUTATION ANALYSIS

- Input is a salutation: „Hey“, „Hi“, „Hello“, „God dag!“, „Kære“, etc.
- Output for each salutation:
 - Language (English, Danish, ...)
 - Level of formality (Formal, Informal, ...)
 - Time of day (Morning, Evening, ...)
- Three steps
 1. Generate synthetic data using OpenAI API: `Magnus_Recap/data_generation/generate.ipynb`
 2. Create a simple app: `Magnus_Recap/final_project/app.py`

THE USE-CASE: SALUTATION ANALYSIS

- Input is a salutation: „Hey“, „Hi“, „Hello“, „God dag!“, „Kære“, etc.
- Output for each salutation:
 - Language (English, Danish, ...)
 - Level of formality (Formal, Informal, ...)
 - Time of day (Morning, Evening, ...)
- Three steps
 1. Generate synthetic data using OpenAI API: `Magnus_Recap/data_generation/generate.ipynb`
 2. Create a simple app: `Magnus_Recap/final_project/app.py`
 3. Provide an evaluation (validation): `Magnus_Recap/final_project/validate.ipynb`

DATA GENERATION

DEPARTMENT OF MANAGEMENT
AARHUS UNIVERSITY

5. December 2025

Magnus Bender
Assistant Professor

8

DATA GENERATION

```
language = ["Danish", "English", "German", "Norwegian", "Swiss German", "French"]
formality = ["very formal", "formal", "informal", "partner"]
time_of_day = ["morning", "mid day", "evening", "night"]
```

DATA GENERATION

```
language = ["Danish", "English", "German", "Norwegian", "Swiss German", "French"]
formality = ["very formal", "formal", "informal", "partner"]
time_of_day = ["morning", "mid day", "evening", "night"]

def generate(language:str, formality:str, time_of_day:str) -> str:
    prompt = "Please generate a short salutation ..."
    prompt += f"Language: {language}, Formality: {formality}, Time of day: {time_of_day}"

    completion = client.chat.completions.create(
        model="gpt-5-nano",
        messages=[{"role": "user", "content": prompt}]
    )
    return completion.choices[0].message.content
```

DATA GENERATION

```
language = ["Danish", "English", "German", "Norwegian", "Swiss German", "French"]
formality = ["very formal", "formal", "informal", "partner"]
time_of_day = ["morning", "mid day", "evening", "night"]

def generate(language:str, formality:str, time_of_day:str) -> str:
    prompt = "Please generate a short salutation ..."
    prompt += f"Language: {language}, Formality: {formality}, Time of day: {time_of_day}"

    completion = client.chat.completions.create(
        model="gpt-5-nano",
        messages=[{"role": "user", "content": prompt}]
    )
    return completion.choices[0].message.content

for i in range(100):
    salutation = generate(random.choice(language),
                          random.choice(formality), random.choice(time_of_day))
```

Generate 100 examples based on random selections of language, formality, and time of day.

DATA GENERATION

```
language = ["Danish", "English", "German", "Norwegian", "Swiss German", "French"]
formality = ["very formal", "formal", "informal", "partner"]
time_of_day = ["morning", "mid day", "evening", "night"]

def generate(language:str, formality:str, time_of_day:str) -> str:
    prompt = "Please generate a short salutation ..."
    prompt += f"Language: {language}, Formality: {formality}, Time of day: {time_of_day}"

    completion = client.chat.completions.create(
        model="gpt-5-nano",
        messages=[{"role": "user", "content": prompt}]
    )
    return completion.choices[0].message.content

for i in range(100):
    salutation = generate(random.choice(language),
                          random.choice(formality), random.choice(time_of_day))
    # write to json file -> the 'salutation' and the values for:
    #   language, formality, time_of_day
```

Generate 100 examples based on random selections of language, formality, and time of day.

RESULT: SYNTHETIC DATA

```
[  
  {  
    "parameters": {  
      "language": "English",  
      "formality": "very formal",  
      "time_of_day": "mid day"  
    },  
    "salutation": "Good afternoon, Sir."  
  },  
  {  
    "parameters": {  
      "language": "French",  
      "formality": "very formal",  
      "time_of_day": "morning"  
    },  
    "salutation": "Bonjour, Monsieur."  
  },  
  ...  
]
```

RESULT: SYNTHETIC DATA

- We know for each item:

```
[  
  {  
    "parameters": {  
      "language": "English",  
      "formality": "very formal",  
      "time_of_day": "mid day"  
    },  
    "salutation": "Good afternoon, Sir."  
  },  
  {  
    "parameters": {  
      "language": "French",  
      "formality": "very formal",  
      "time_of_day": "morning"  
    },  
    "salutation": "Bonjour, Monsieur."  
  },  
  ...  
]
```

RESULT: SYNTHETIC DATA

- We know for each item:
 - The used parameters
 - Won't be visible to the app
 - Are the ground truth to compare to later

```
[  
  {  
    "parameters": {  
      "language": "English",  
      "formality": "very formal",  
      "time_of_day": "mid day"  
    },  
    "salutation": "Good afternoon, Sir."  
  },  
  {  
    "parameters": {  
      "language": "French",  
      "formality": "very formal",  
      "time_of_day": "morning"  
    },  
    "salutation": "Bonjour, Monsieur."  
  },  
  ...  
]
```

RESULT: SYNTHETIC DATA

- We know for each item:
 - The used parameters
 - Won't be visible to the app
 - Are the ground truth to compare to later
 - The generated salutation
 - Inputs for our app as test cases
 - Are used as basis to compare with the estimates/ predictions of our app

```
[  
  {  
    "parameters": {  
      "language": "English",  
      "formality": "very formal",  
      "time_of_day": "mid day"  
    },  
    "salutation": "Good afternoon, Sir."  
  },  
  {  
    "parameters": {  
      "language": "French",  
      "formality": "very formal",  
      "time_of_day": "morning"  
    },  
    "salutation": "Bonjour, Monsieur."  
  },  
  ...  
]
```

AN APP

The screenshot shows a web application window titled "Example App for Salutation Analysis" with the URL "127.0.0.1". The main content area displays the text "This app takes any salutation and creates a simple analysis." Below this, a text input field contains "Bonjour, Monsieur." A blue button labeled "RUN ANALYSIS" is visible. The "Results" section shows the input text and a table of analysis attributes:

ATTRIBUTE	VALUE
Language	French
Formality	formal
Time of Day	mid day

AN APP

- Two files:

The screenshot shows a web application window titled "Example App for Salutation Analysis" with the URL "127.0.0.1". The main content area displays the text: "This app takes any salutation and creates a simple analysis." Below this, a text input field contains "Bonjour, Monsieur." A blue button labeled "RUN ANALYSIS" is visible. The "Results" section shows the input text and a table of analysis attributes:

ATTRIBUTE	VALUE
Language	French
Formality	formal
Time of Day	mid day

AN APP

- Two files:
 - `salutation_analysis.py`
 - Contains the actual analysis process:
 - `async def analyze_salutation(salutation:str) -> SalutationAnalysis`

```
response = await client.responses.parse(
    model="gpt-5-nano",
    ...
    text_format=SalutationAnalysis
)
return response.output_parsed
```

The screenshot shows a web application window titled "Example App for Salutation Analysis". The URL in the address bar is 127.0.0.1. The page content includes a description: "This app takes any salutation and creates a simple analysis." A text input field contains the text "Bonjour, Monsieur.". A "RUN ANALYSIS" button is present. Below the input, the text "Results" is displayed, followed by the input text "Bonjour, Monsieur.". A table titled "Salutation" shows the analysis results:

ATTRIBUTE	VALUE
Language	French
Formality	formal
Time of Day	mid day

AN APP

- Two files:
 - `salutation_analysis.py`
 - Contains the actual analysis process:
 - ```
async def analyze_salutation(salutation:str) -> SalutationAnalysis:
 response = await client.responses.parse(
 model="gpt-5-nano",
 ...
 text_format=SalutationAnalysis
)
 return response.output_parsed
```
  - `app.py`
    - Contains the NiceGUI interfaces and functions
    - ```
from salutation_analysis import analyze_salutation

analysis = await analyze_salutation(salutation)
```

The screenshot shows a web application window titled "Example App for Salutation Analysis" with the URL "127.0.0.1". The application interface includes a text input field with the placeholder "Please type your salutation!" containing the text "Bonjour, Monsieur.", a "RUN ANALYSIS" button, and a "Results" section. The "Results" section displays the input salutation and a table of analysis attributes and their values:

ATTRIBUTE	VALUE
Language	French
Formality	formal
Time of Day	mid day

VALIDATION

DEPARTMENT OF MANAGEMENT
AARHUS UNIVERSITY

5. December 2025

Magnus Bender
Assistant Professor

11

VALIDATION

Use the same actual analysis process as the app (analyze_salutation function).

```
from salutation_analysis import analyze_salutation
```

VALIDATION

Use the same actual analysis process as the app (analyze_salutation function).

```
from salutation_analysis import analyze_salutation

async def single_validation(data_item:dict[str,dict[str,str]|str]) -> tuple[str, str]:
    sal, par = data_item['salutation'], data_item['parameters']
    analysis = await analyze_salutation(sal)

    ground_truth = par['language'], par['formality'], par['time_of_day']
    estimates = analysis.language, analysis.formality, analysis.time_of_day

    return ground_truth, estimates
```

VALIDATION

Use the same actual analysis process as the app (analyze_salutation function).

```
from salutation_analysis import analyze_salutation

async def single_validation(data_item:dict[str,dict[str,str]|str]) -> tuple[str, str]:
    sal, par = data_item['salutation'], data_item['parameters']
    analysis = await analyze_salutation(sal)

    ground_truth = par['language'], par['formality'], par['time_of_day']
    estimates = analysis.language, analysis.formality, analysis.time_of_day

    return ground_truth, estimates

await single_validation({
    "parameters": {"language": "English", "formality": "informal", "time_of_day": "evening" },
    "salutation": "Hey, good evening!"
})
```

VALIDATION

Use the same actual analysis process as the app (analyze_salutation function).

```
from salutation_analysis import analyze_salutation

async def single_validation(data_item:dict[str,dict[str,str]|str]) -> tuple[str, str]:
    sal, par = data_item['salutation'], data_item['parameters']
    analysis = await analyze_salutation(sal)

    ground_truth = par['language'], par['formality'], par['time_of_day']
    estimates = analysis.language, analysis.formality, analysis.time_of_day

    return ground_truth, estimates

await single_validation({
    "parameters": {"language": "English", "formality": "informal", "time_of_day": "evening" },
    "salutation": "Hey, good evening!"
})
# (('English', 'informal', 'evening'), ('English', 'informal', 'evening'))
```

PROCEED

3. **Files to include:** Check for each of the three paths (*data creation*, the *NiceGUI app*, and *validation*) which files to include or exclude.

Include as <i>Data creation</i> in /data_generation	Include as <i>NiceGUI app</i> in /final_project	Include as <i>Validation</i> in /final_project
<input checked="" type="checkbox"/> /generate.ipynb	<input checked="" type="checkbox"/> /salutation_analysis.py	<input checked="" type="checkbox"/> /salutation_analysis.py
<input checked="" type="checkbox"/> /synthetic-data.json	<input checked="" type="checkbox"/> /app.py	<input checked="" type="checkbox"/> /app.py
Select main file (to run GUI/ start validation) /generate.ipynb	<input checked="" type="checkbox"/> /validate.ipynb	<input checked="" type="checkbox"/> /validate.ipynb
	Select main file (to run GUI/ start validation) /app.py	Select main file (to run GUI/ start validation) /validate.ipynb

Python script containing analysis code is used by app and validation

EXPORT APP

- Exemplary export of salutation app on uCloud.
- Salutation app has only two folders:
 - **data_generation**
 - Data and generation notebook
 - **final_project**
 - App and validation code

Project Export

1. **Base Path:** Please select or type the base path where your project is located.

Project Base Path
/NiceGUI/Magnus_Recap

2. **Three Parts:** Please indicate the three paths for *data creation* (optional), the *NiceGUI app*, and *validation*.

Data creation (optional)
/data_generation

NiceGUI app
/final_project

Validation
/final_project

PROCEED

3. **Files to include:** Check for each of the three paths (*data creation*, the *NiceGUI app*, and *validation*) which files to include or exclude.

Include as *Data creation* in /data_generation Include as *NiceGUI app* in /final_project Include as *Validation* in /final_project

/generate.ipynb /salutation_analysis.py /salutation_analysis.py

/synthetic-data.json /app.py /app.py

Select main file (to run GUI/ start validation)
/generate.ipynb

Select main file (to run GUI/ start validation)
/app.py

Select main file (to run GUI/ start validation)
/validate.ipynb

Python script containing analysis code is used by app and validation

Different main files for app and validation

Same folder for app and validation

CLOSING REMARKS

- This is a small example, there are many many ways to do things like this!

CLOSING REMARKS

- This is a small example, there are many many ways to do things like this!
- If you have real data, you will still need labels/ desired outputs, but ...
 - ... may create them manually.
 - ... may use a free data set from the internet.
 - ... may ask a different LLM for labels (slightly weak, but totally fine for project). ...

CLOSING REMARKS

- This is a small example, there are many many ways to do things like this!
- If you have real data, you will still need labels/ desired outputs, but ...
 - ... may create them manually.
 - ... may use a free data set from the internet.
 - ... may ask a different LLM for labels (slightly weak, but totally fine for project). ...
- You do not need to have your „core functionality“ in a separate file (as in example project for importing from `app.py` and `validate.ipynb`)
 - You may export results from your app.
 - You may copy code. ...

- You do not need to have your „core functionality“ in a separate file (as in example project for importing from `app.py` and `validate.ipynb`)
 - You may export results from your app.
 - You may copy code. ...
- Each validation will be different!
 - Depending on the use-case, you need to evaluate in different settings and need different approaches to be able to calculate scores.
 - Don't worry about the actual values of your scores, we do not grade based on them!

TEACHING EVALUATION

DEPARTMENT OF MANAGEMENT
AARHUS UNIVERSITY

5. December 2025

Magnus Bender
Assistant Professor

TEACHING EVALUATION

Thank you for your feedback and
comments!

REOCCURRING TOPICS

- Course description: Discrepancies between expectations and reality
 - Will update for next year

REOCCURRING TOPICS

- Course description: Discrepancies between expectations and reality
 - Will update for next year
- Structure and order of lectures
 - Plan to rearrange some of them
 - Start earlier with practical requirements for project

REOCCURRING TOPICS

- Course description: Discrepancies between expectations and reality
 - Will update for next year
- Structure and order of lectures
 - Plan to rearrange some of them
 - Start earlier with practical requirements for project
- Feedback system
 - Did not scale with 150 students in class → will revise to new system next year
 - Nice ideas like 1-1 consultations with us

REOCCURRING TOPICS

- Course description: Discrepancies between expectations and reality
 - Will update for next year
- Structure and order of lectures
 - Plan to rearrange some of them
 - Start earlier with practical requirements for project
- Feedback system
 - Did not scale with 150 students in class → will revise to new system next year
 - Nice ideas like 1-1 consultations with us
- Coding and technical skills
 - Difficult to change: Right now the aim is that you have to program something
 - Consider while revising course description
 - More classic/ detailed „Introduction to programming“ difficulty to fully fit in
